Mr. James D. Loock Chief Engineer, Electric Division Public Service Commission of Wisconsin 610 North Whitney Way Post Office Box 7854 Madison, Wisconsin 53707-7854

Electric Division

Subject: PSC 113.0607 - Appropriate Inspection and Maintenance System Reliability

Dear Mr. Loock:

To satisfy the requirements of the service rule referenced above, enclosed is MGE's Plan for all electric generation assets owned, operated, and maintained by the company. MGE is a joint owner of the Columbia Energy Center and Kewaunee Nuclear Power Plant and will rely on the operators of these facilities to submit a Plan to meet the requirements of this service rule. MGE's electrical generation assets which are owned, operated, and maintained by the company are made up of nine (9) boilers, six (6) steam turbine/generators, five (5) combustion turbine/generators, and fifty-five (55) diesel engine/generators. A sixth combustion turbine/generator, West Marinette Combustion Turbine, is owned and operated by MGE but is maintained under a maintenance contract by Wisconsin Public Service Corporation. Specific electric generation asset data is identified in the enclosed Electrical Generation Asset List - Exhibit A.

I would like to point out that all MGE electrical generation equipment, except for the West Marinette Combustion Turbine, is nameplate rated below 50 MW. Based upon discussions during the August 9, 2000, meeting, the PSC 113.0607 Preventative Maintenance Plan being submitted for units less than 50 MW will not include generator performance reports.

I believe the Plan being submitted satisfies the requirements of PSC 113.0607, but if you have any questions or require additional information, please contact me at you earliest convenience.

Sincerely,

Steven C. Dietrich, P.E.

Director - Blount Maintenance and Stores

I. PREVENTATIVE MAINTENANCE PLAN

A. INTRODUCTION

The Preventative Maintenance Plan is being submitted to satisfy the requirements of PSC 113.0607. The Plan outlines the inspection interval, inspection methods, items checked, condition rating criteria, and corrective action.

The inspection intervals fall into several different categories, **Routine**, **Major**, and **Condition Based**. Routine inspections are generally performed by Operators who conduct periodic inspections (i.e., rounds) while the equipment is operating and take note of pressures, temperatures, operating levels, unusual noises, etc., and record this information. Major inspections, performed by maintenance staff, generally occur on a timed basis and are scheduled based upon historical maintenance requirements or OEM recommendations. Conditioned-based inspections occur whenever unusual operating or performance symptoms are detected (i.e., unusual vibrations, lower than expected capacities, etc.).

Inspection Method describes the type of inspection that is performed.

Items Checked describes in detail the specific operating items or equipment components inspected.

Condition Rating criteria describes what standards are utilized in determining if an inspection item is out of tolerance or performing unacceptably.

Corrective Action describes the type of action required to correct the inspection item.

B. SCOPE OF PLAN

The Preventative Maintenance Plan is developed for the following types of generation assets: Steam Production, Turbine, and Generator Equipment; Combustion Turbine/Generator Equipment; and Diesel Engine/Generator Equipment. The Plan is primarily focused on the major pieces of equipment utilized in the production of electricity. The major pieces of equipment are identified as follows:

Steam Production, Turbine, and Generator Equipment

Boilers
Boiler Feedwater Pumps and Drives
Forced Draft Fans and Drives
Induced Draft Fans and Drives
Primary Air Fans and Drives
Pulverizers and Drives
Electrostatic Precipitators
Ash System

Continuous Emission Monitors Steam Turbines/Generators Condensers Condensate Pumps and Drives Circulating Water Pumps and Drives Switchgear Controls

Combustion Turbine/Generator Equipment

Diesel Engine/Generator Equipment

II. MAINTENANCE BUDGET PROCESS

The Company prepares an O&M budget on a two-year cycle to coincide with the rate case. The budgets are then adjusted annually to reflect any changes. Specific work activities which generally are repeated from year to year are evaluated and adjusted according to historic spending levels, results of preventative and predictive maintenance programs, and prior outage inspections. In addition, a rolling ten-year Fixed Capital budget is prepared. As it becomes uneconomical to repair equipment, the Fixed Capital budget is adjusted to reflect the replacement of equipment. In addition, the Fixed Capital budget is adjusted to account for the upgrade or replacement of equipment due to changes in regulations, future power requirements, and other Company initiatives.

III. GENERATOR UNIT PERFORMANCE DATA

The following information will be reported on generator nameplates rated >50 MW:

Summer Capacity (MW)
Winter Capacity (MW)
Net Dependable Capacity (MW)
Generation (MWh)
Heat Rate (BTU/KWh)
Capacity Factor
Fuel Consumed
Forced Outage Rate
Scheduled Outage Factor

Overview

Madison Gas and Electric Company (MGE) has compiled a comprehensive maintenance plan that articulates the Company's practices for inspecting and maintaining electric operating facilities.

Preventative maintenance for transmission and distribution equipment, outside of substation facilities, is based on results of regularly scheduled inspections.

Much of this equipment is static, performing its function just by existing where it does on the system, like a pole or guy wire. For many of these facilities, remediation or replacement is prudent upon imminent or actual failure. Action taken as a result of inspections is sufficient to maintain reliability in these cases.

For active equipment on the system, it is important for the more complex and critical parts of the system to be operational when needed. Active equipment is inspected and maintained to ensure this equipment can carry out the needed function on the system, thus ensuring system reliability.

Inspections and preventative maintenance for substation facilities are completed according to the schedules and guidelines specified in the Substation Maintenance Standards. Substation facilities are generally considered to be active and require significant inspection and maintenance.

MGE's inspection and maintenance meet inspection standards included in the *National Electrical Safety Code*.

Report forms, checklists, and guidelines for electric facility inspections are included as appendices for reference.

Transmission, Distribution, and Substation Facilities

Introduction

Transmission, distribution, and substation facilities can be viewed as static or active.

Static equipment includes items like supporting structures, cabinets, and many interconnecting parts that bring the system together. These items are generally designed to operate 20 years or more without any planned maintenance and have few, if any, moving parts. MGE's approach to maintaining static equipment consists of regular inspections to detect imminent or actual failures and repairing or replacing the components as necessary. The inspection cycle is chosen to eliminate the need to track equipment that might be deteriorating. If a piece of equipment cannot be counted on to safely reach the next inspection, it is replaced.

Active equipment is likely to have moving parts, sensors, oil, load break contacts, or other parts that could fail, possibly without immediate indication. MGE's approach to these items is frequent and routine inspections, along with scheduled testing and maintenance appropriate for the piece of equipment consistent with manufacturer's recommendations and industry practice.

Active equipment in this category may have a progressive maintenance condition that will deteriorate in a predictable way. An example of this is elevated levels of certain gases in oil-filled equipment. Such an elevated level may indicate a developing problem, but the situation may not require immediate action.

The Company will also perform regular maintenance on this equipment. This would include actions such as changing the contact, performing timing or other tests, filtering oil, etc.

In the event that a large or expensive piece of equipment is found to be in a state where major repair or replacement is immediately necessary, the Company will replace it with available equipment. After prompt removal of the affected equipment, a repair or replacement budget is prepared for the next budget year or existing budgets are adjusted. Smaller repairs are budgeted based on historical experience of maintenance requirements for this type of equipment.

Methods and Tools

The primary methods used in inspection of transmission and distribution facilities are visual, thermal, and infrared inspection. On the underground distribution system a TDR (Time Domain Reflectometer) is used to assess neutral condition. Inspections of substation facilities are also primarily done using visual, thermal, and infrared methods. Lab testing is done on oil and gas samples as a part of the maintenance routines.

Relays and other sensing equipment undergo a variety of tests according to manufacturers' recommendations. This testing requires relay test equipment and computer software. Increasingly, these tests are incorporated into the equipment itself and the monitoring is automated.

Condition Criteria

Criteria used to rate the condition of facilities falls into four categories. The categories prioritize issues by immediate response required (Category 1), timely response required (Category 2), address during scheduled maintenance (Category 3), and acceptable operating condition (Category 4).

Repair and replacement policy provides for different levels of response appropriate for different conditions.

Category 1 - Immediate Response

In any case where public safety is at issue, MGE responds immediately to correct the problem. In these cases, the inspector is trained to call an Electric Operations supervisor for any condition the inspector cannot fix. Simple conditions such as a missing pentabolt or lock can be repaired by the inspector. Conditions that indicate an imminent failure likely to cause an outage or damage to equipment will trigger an immediate response also.

MGE takes its responsibility toward the environment very seriously. Consequently, problems of an environmental nature receive immediate response.

Category 2 - Timely Response

A timely response is generally considered to be one that occurs any time before the next inspection. This work is normally assigned to the Construction Department for fill-in work. For underground distribution equipment, a timely response may occur after the next inspection due to the very short inspection cycle used.

Category 3 – Monitoring Status

Category 3 items are maintenance items that, while not likely to create problems prior to the next inspection cycle, may be expected to continue to deteriorate with age. Subsequent inspections will be used to determine the appropriate time to correct these problems.

Substation and transmission facilities typically include more active equipment. As a result, minor issues will be corrected during the next scheduled maintenance. Issues involving larger and more complex equipment will be monitored, and an appropriate and economic solution will be planned.

Category 4 – Acceptable Operating Condition

Category 4 items are in acceptable operating condition at the time of inspection. No action is required until the next scheduled inspection.

Budgeting

Budgeting for routine repairs and maintenance items throughout MGE's system is based on historical experience. Each year the operating departments review the past year's experience with respect to maintenance and repair activity. The next year's budget is adjusted to reflect historical trends and anticipate future needs.

In the event that a large or expensive piece of equipment is found to be in a state where major repair or replacement is necessary, the Company will replace it with available equipment. After prompt removal of the affected equipment, a repair or replacement budget is then prepared for the next budget year or budgets are adjusted accordingly.

Transmission Inspection Summaries

Overhead Transmission Lines

| Item | Interval | Description | Inspection | Correction |
|---------|----------------|---|--|--|
| Aerial | Twice per year | Attached hardware Paint condition Right-of-way condition and signage General condition of conductors, dampers, towers | Completed inspection forms Summary spreadsheet Kept in Electric Operations | Job ordersTime sheets |
| Walking | Annual | Tower condition and guys Attached hardware Conductor condition Paint condition and signage Right-of-way condition Foundation condition | Spreadsheet in Electric Operations | Job ordersTime sheets |

Overhead transmission lines are flown over and visually inspected twice a year. Inspected items include:

- Insulators
- · Ground wire and ground wire moldings
- · Guy shields
- Signage
- Tree growth
- Paint condition
- Supporting structures

Each structure is inspected according to the patrol checklist for each specific line. Issues are noted and transcribed into an electronic spreadsheet maintained by Electric Operations.

Issues found requiring immediate attention are resolved as soon as feasible. Issues not requiring immediate attention are handled as time permits according to their priority. Work done to resolve issues can be traced through the job order system and field crew time sheets.

Sonic testing on wood laminated crossarms in the system is done as needed. These crossarms are being phased out of the system.

Condition criteria

Category 1

- Unauthorized persons working on easement
- Floating (unattached) static wire
- Multiple broken insulators compromising safety
- Leaning or damaged structures

Category 2

- Multiple broken insulators compromising reliability
- Damaged conductors
- Trees requiring nonroutine trimming to prevent imminent outages

Category 3

- Single broken insulators
- · Right-of-way maintenance, changed conditions, and possible encroachment
- Trees requiring routine trimming
- · Towers requiring painting
- Tower ground wires needing repair
- · Dampers loose

Wood Transmission Poles

| Item | Interval | Description | Inspection | Correction | |
|------|----------|--|--|---|--|
| Pole | 10 years | Pole type and age Deterioration and insect infestation Decision to repair/replace, treat pole butt All items identified by walking inspection | Hard copy report Kept in Electric Operations | Job order Time sheets | |

Wood poles undergo additional ground line inspection and treatment on a ten-year cycle. Inspections determine which poles are treated or replaced. While performing ground-line inspections, pole hardware and attachments are visually inspected. Inspection reports are provided by the contractor after performing the work and are filed in Electric Operations. The follow-up work can be found in job order documentation and crew time sheets.

Condition criteria

Category 1

- Loose hardware on poles
- Poles with dangerous amounts of pole rot or other structural damage
- Missing ground moldings or guy shields
- Missing or damaged warning signs

Category 2

- Poles that no longer meet codes for structural strength
- · Damaged poles

Category 3

- Routine replacement or reinforcement of damaged or aged poles
- · Repairing grounds and static connections

Underground Transmission

| Item | Interval | Description | Inspection | Correction |
|----------------------------|------------|---|--|--|
| Facility Patrol | Weekly | Right-of-way condition and activity Ground and site condition Structures and related hardware | Kept in Corp. Records | Job orders Time sheets |
| Anode testing | Semiannual | Anode condition | Annual summaryKept in Corp.Records | Job orders Time sheets |
| Cathodic protection | Biweekly | • Visual | Kept in Corp. Records | Time sheets |
| Sheathing voltage limiters | Annual | Tested with high-voltage test | Kept in Corp. Records | Job orders Time sheets |

The underground transmission system is patrolled weekly. Items inspected include:

- Any construction or renovation
- Tree growth
- Ground condition
- Manhole covers
- Signage
- Riser structures
- Substation fence and appearance

Anodes are inspected twice each year and adjustments and repairs are made as needed. Line patrol reports are completed, routed internally, and stored in Corporate Records.

Condition criteria

Category 1

- Displaced manhole covers
- Unauthorized digging on the right-of-way
- · Leaking oil
- · Fencing missing or damaged
- Damaged or missing signage

Category 2

- Located routes indicated near trench routes for excavation
- Vandalism

Category 3

- Deteriorated manholes
- Rusted manway or manhole covers

Special Transmission Issues

| Item | Interval | Description | Inspection | Correction |
|-------------------------------------|-----------|--|---|--|
| Thermal Imaging (tester and camera) | As needed | Check for hot spots on equipment | Test results notedKept in Operations Support | Job orders Time sheets |
| Corona Discharge (rented camera) | As needed | Rented equipment to inspect for corona discharge | Images stored on videotapeKept in Operations Support | Job orders Time sheets |

Distribution Inspection Summaries

Distribution facility inspections include:

- Underground distribution equipment
- Overhead distribution equipment
- Wood poles including signage and hardware
- Distribution network vault system including spot and grid facilities
- Company-owned equipment in customer-owned vaults

Underground Distribution

| Item | Interval | Description | Inspection | Correction |
|----------------|----------|---|---|---|
| Switchgear | 3 years | Equip. configuration Protection information As-built details | Electronic transfer and storage by Operations Support | Hard copy in Electric OperationsJob ordersTime sheets |
| Transformers | 3 years | Equip. configurationProtection informationAs-built details | Electronic transfer and storage by Operations Support | Hard copy in Electric OperationsJob ordersTime sheets |
| Elbow cabinets | 3 years | Equip. configurationAs-built details | Electronic transfer and storage by Operations Support | Hard copy in Electric OperationsJob ordersTime sheets |
| Pedestals | 3 years | Visual check of physical condition | Electronic transfer and storage by Operations Support | Hard copy in Electric OperationsJob ordersTime sheets |

Underground distribution facilities are inspected every three years. Equipment inspected includes:

- Switchgear
- Transformers
- Elbow cabinets
- Pedestals

Equipment configuration, including switch and fuse information, is verified using hard copies of switch diagrams. Notes and as-built details are recorded and relayed to Drafting Services for correction.

Issues addressed during inspection include:

- Installation condition
- Signage
- Hardware condition

Follow-up work is tracked using hard copy reports, job orders, and crew time sheets. These records are kept in Electric Operations.

Condition criteria

Category 1

- · Open cabinets, lock and pentahead bolt does not meet double-lock requirement
- Cabinets with rust holes
- · Damaged cabinets where live equipment is a hazard
- Swollen elbows
- · Missing or damaged warning signs
- · Cabinets displaced on pad
- Oil leaks

Category 2

- Overheated connections
- Animal damage
- Damaged protective posts

Category 3

- · Cabinets requiring painting
- Pads requiring straightening

Underground Distribution Network Vaults

| Item | Interval | Description | Inspection | Correction |
|----------------|----------|---|--|--|
| Network vaults | Biweekly | Number of operations Position of protective devices Transformer information | Hard copy records Electronic pilot program under way Corp. Records | Job orders Time sheets |

Underground distribution network vaults are inspected every two weeks. Items inspected include:

- Number of operations
- · Position of protective devices
- Transformer disconnect position
- Transformer oil level
- Transformer temperature
- General conditions

Condition criteria

- · Damaged network equipment
- Malfunctioning protectors
- Damaged vault covers and equipment
- Excessive water

Category 2

· Cable damage including abrasion and leaks

Category 3

- Equipment requiring cleaning
- Equipment requiring painting
- Rust on vault covers

Customer-Owned Vaults

| Item | Interval | Description | Inspection | Correction |
|---------------------------|----------|---|--|--|
| Customer- owned vaults | 3 years | Transformer conditionCable/wire conditionVault security | Inspection report files Stored in Electric Operations Electronic summary | Job orders Time sheets |

Company-owned equipment in customer-owned vaults is inspected about every three years. In addition to inspection, cleaning is also done. Inspection items include:

- Transformer condition
- Primary and secondary service wire condition
- · Vault security including locks
- Lighting and signage

Issues found are recorded on the Customer-Owned Transformer/Enclosure Inspection form (see Appendix F). Follow-up work can be tracked in the job order system and the field crew time sheets.

Condition criteria

Category 1

- · Damaged enclosure, vault entrance, or locks
- Unsecured facilities

Category 2

- Malfunctioning protectors
- Cable damage
- Signage

- Equipment requiring cleaning
- Painting of equipment
- Enclosures requiring weed control

Overhead Gang-Operated Air Break (GOAB) Switches

| T4 | Interval | Description | Inspection | Correction |
|-------------------|-----------|---------------------|--------------------------------------|--|
| Switches Switches | 10 years | Equipment condition | Hard copy in Electric Operations | Job orders Time sheets |
| | As needed | Operating condition | Time sheets | Job orders Time sheets |

Switch inspection items include insulators, contacts, jumpers, and operating condition. Overhead switches are inspected every ten years or as needed. Follow-up work can be tracked in the job order system and field crew time sheets.

Condition criteria

Category 1

- · Damaged control handles
- Broken insulators
- Missing locks

Category 2

- · Bad connections
- Minor lightning damage
- · Overheated switchblades

Category 3

- Switches that require lubrication
- · Lock issues

Overhead Capacitor Banks

| Item | Interval | Description | Inspection | Correction |
|-----------------|----------|--|----------------------------------|--|
| Capacitor banks | Annual | Switch condition Capacitor condition Switch and control operation Arrester/cutout condition | Records in Electric Planning | Job orders Time sheets |

Capacitor banks are inspected every year and maintenance items that need to be addressed are recorded. The inspection records are informal at this time, and issues found are dealt with as needed. A formal program will be implemented in 2001 for recording inspections and follow-up work.

Condition criteria

- · Swollen units
- Burnt cutouts
- Loose equipment

Category 2

- · Blown fuses
- Maintenance on controls
- Hot connections

Category 3

Damaged animal guards

Overhead Distribution Poles

| Item | Interval | Description | Inspection | Correction |
|-------|----------|---|--------------------------------------|--|
| Poles | 10 years | Pole condition near the ground line Visual inspection of attached hardware | Hard copy in Electric Operations | Job orders Time sheets |

Distribution poles undergo rigorous ground line inspection every 10 years. The primary goal of this inspection concerns pole condition near the ground line. A visual inspection is done concerning the attached hardware. Issues are noted in the inspection records and handled accordingly.

Follow-up notes are kept in Electric Operations. Follow-up work concerning rejected poles can be traced to job orders in the job order system and on field crew time sheets.

Condition criteria

Category 1

- Poles that are broken or unsupported
- Leaning poles that create a hazardous situation
- Broken insulators

Category 2

- Cracked insulators
- Broken crossarms
- Leaning poles
- Poles with ground rot or charring
- Poles with ground-line damage
- Damaged down guys
- Trees requiring nonroutine trimming

- Routine maintenance required on aged equipment
- Trees requiring routine trimming
- Secondary and services requiring work or replacement

Substation Inspection Summaries

Overview

Transmission and distribution substations are inspected according to guidelines defined in the Substation Maintenance Standards. Inspection and maintenance for substations is the most labor-intensive of the transmission, distribution, and substation facilities. Inspections are done biweekly, and more comprehensive inspections are done once every five years or more and include preventative maintenance activities. The exact schedule varies with each piece of equipment.

Results of routine inspections are captured in an exception report kept as an electronic spreadsheet. A hard copy logbook is kept at each substation where readings, comments, and inspectors' initials are recorded. Logbook entry samples are included in Appendix D.

Results of comprehensive inspections are stored electronically by field personnel on a portable computer and backed up on the computer network.

Follow-up work is assigned based on criticality of the issue, resulting in less critical work done as time permits. Some notes are kept on paper copies as needed.

Guidelines and schedules for routine and comprehensive inspections are included in MGE's Substation Maintenance Standards (see Appendix D for table of contents).

Included in Appendix K are reporting forms that Electric Meter Shop generally use as guidelines for completed inspections. These forms are for line reclosers, automatic transfer switchgear, voltage regulators, nitrogen at substations and presently, backup generators.

Condition criteria for substation facilities:

Category 1

- · Any oil leaks where oil is actively leaking to the ground
- Power outages
- Equipment leaks
- Compressor problems
- Improper voltage regulation

Category 2

- Oil weeping on equipment (not on ground)
- Oil filtering due to low dielectric found on annual inspections
- Grounds in DC system

- Annual oil samples
- · Annual battery maintenance
- · Oil leaks internal to equipment

Substation Maintenance Standards

The Substation Maintenance Standards (SMS) are the protocol for inspection and maintenance work. This includes what is done during inspections conducted on cycles of weeks, maintenance and testing done on cycles of years, and any additional tests or procedures that may be needed.

The maintenance standards include sections on the following equipment:

- Station batteries, racks, and chargers
- Power transformers
- · Load tap changers
- Power circuit breakers
- Switches
- Bus work
- Emergency generators

- Relays
- Reclosers
- Regulators
- Capacitors
- Grounding systems
- Communications systems

Other information in the standards includes hard copy forms used for inspection, testing and maintenance, and information on test equipment. Sections addressing environmental concerns and general safety are also included.

Station Batteries, Racks, and Chargers

| Interval | Description | Inspection | Correction |
|----------|---|----------------------|--|
| Biweekly | Visual Battery check | Exception report | Exception reportTime sheets |
| Annual | VisualBattery measurements | Electronic documents | Job ordersTime sheets |

Biweekly inspections include:

- Overall visual inspection of batteries and associated equipment to check for deterioration
- Electrolyte fluid level and leaks
- Battery charger voltage, currents, and grounds

Annual inspections include:

- Cell impedance checks
- · Cell voltage checks
- Specific gravity checks
- Strap resistance between cells
- Clean up connection points (clean, grease, and torque)

Power Transformers

| Interval | Description | Inspection | Correction |
|-----------|---|--------------------------------------|--|
| Biweekly | Visual Transformer systems check | Exception report | Exception reportTime sheets |
| Annual | VisualThermal imagingOil sampleGas analysis and sample | Electronic documents Lab reports | Job orders Time sheets |
| As needed | Visual Transformer tests Process oil | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

- Nitrogen gas pressure checks
- Gas and oil leaks
- Oil level and temperature check
- Winding temperature
- · Cooling fan status
- Oil circulating pump status
- Porcelain condition
- Desiccant filter condition
- Compartment heaters

Annual inspections and maintenance include:

- Transformer oil levels (including bushings and conservator)
- · Bushing condition
- Cooling system including fan and oil circulating pump, controls, lubing as necessary, and debris removal
- Perform infrared scan on radiators
- · Check control wiring and junction boxes
- · Check grounding including pad and surrounding grid
- Perform oil tests for dielectric, color, and acidity
- Combustible gas analysis using a portable unit, purging or pressurizing nitrogen gas as necessary
- Dissolved gas sample from transformer for outside lab analysis

Additional tests done as needed include:

- Transformer tests
- Internal visual inspection of transformer condition
- Impedance tests of coil and core
- Filter oil and heat process oil, new or existing
- Power factor test when transformer is new or tap position is changed
- Turns ratio test when transformer new or tap position is changed
- Dielectric absorption test to check insulation

Load Tap Changers

| Interval | Description | Inspection | Correction |
|-----------|---|--|--|
| Biweekly | Visual | Exception report | Exception report |
| Annual | VisualExercise equipmentOil sample for test | Electronic documentsLab reports | Job orders Time sheets |
| As needed | Visual Check contact Filter oil Turns ratio test | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

- · Check for oil level, oil and gas leaks
- Veeder count (number of operations)
- Tap position and range, resetting drag hands as applicable
- Control setting and mode
- Compartment heaters

Annual inspections include:

- Oil sample for dielectric, color, and acidity
- Operate tap changer control and verify control sequence and alarms
- Operate load tap changer over a range of positions and the off positions
- Compartment heaters

Additional tests done as needed include:

- Internal visual inspection of connections and parts
- Check condition of contacts and drag fingers, and replace as needed
- Filter oil
- Perform a turns ratio test when commissioning a transformer or as needed, operating through all the tap positions

Power Circuit Breakers

| Interval | Description | Inspection | Correction |
|----------|---|--|--|
| Biweekly | • Visual | Expectation report | Expectation reportTime sheets |
| Annual | Pneumatic equipment checkOil sample | Electronic documents Lab reports | Job orders Time sheets Job orders |
| 5 Years | Visual Exercise equipment Check contacts and equipment | Electronic documentsLab reports | • Time sheets |
| | Oil sample | | |

Biweekly inspections include:

- · Oil leaks
- Status of breaker, control, and recloser
- Verify trip air pressure and check for leaks
- Veeder counts
- · Check over compressor, drain water, and check pressures
- Accumulator pressure and hydraulic pressure
- Confirm proper pressure in all SF6 equipment

Annual inspections and maintenance include:

- Oil sample for dielectric, color, and acidity
- Check and maintain pneumatic systems, and verify limits and proper operation

Inspections done every five years include:

- · Check contacts; maintain and adjust for proper operation
- External visual inspection to check for:
 - Connections
 - Conditions
 - Oil level and seals
 - Ground connection
 - Breaker foundation
- Internal visual inspection to check for:
 - Loose connections
 - Corrosion
 - Broken seals
 - Worn linkage
- Contact replacement as needed
- Oil sample for dielectric, color, and acidity
- Filter oil
- · Operate breaker trip mechanism and verify travel and operation
- Operate breaker control operation

Switches

| Interval | Description | Inspection | Correction |
|----------|-----------------|----------------------|--|
| Biweekly | • Visual | Exception report | Exception reportTime sheets |
| Annual | Visual | Electronic documents | • Job orders |
| Ailliuai | Thermal imaging | | Time sheets |

Biweekly inspections include:

Visual inspection of switch components to check for any damage

Annual inspections and maintenance include:

• Check the switches using thermal imaging

Bus Work

| Interval | Description | Inspection | Correction |
|----------|-----------------|----------------------|------------------|
| Biweekly | Visual | Exception report | Exception report |
| Biweekiy | V ISUAI | | Time sheets |
| Annual | Visual | Electronic documents | Job orders |
| Annual | Thermal imaging | | Time sheets |

Biweekly inspections include:

· Visual inspection to check for any damage

Annual inspection and maintenance includes the following:

• Scan bus work and structures with thermal imaging to check for overheating

Emergency Generators

| Interval | Description | Inspection | Correction |
|----------|---|----------------------|--|
| Biweekly | • Visual | Exception report | Exception report Time sheets |
| Annual | Exercise equipmentBattery checkOil, filters, and valves | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

- · Visual inspection of generators and batteries to check for leaks, corrosion, and structural damage
- Check fluid levels

Annual inspections and maintenance include:

- Operate the generators monthly
- Check moving parts and lube
- Change oil and filter
- · Check and clean all other filters and valves
- · Check:
 - Cell impedances
 - Cell voltages
 - Specific gravities
 - Cell-to-cell strap resistances
- Check and maintain connection points

Relays

| Todamal | Description | Inspection | Correction |
|----------------------|---|----------------------|--|
| Interval Biweekly | Procedures and guidelines are included in | Exception report | Exception reportTime sheets |
| 5 Years | the SMS. Procedures and guidelines are included in | Electronic documents | Job orders Time sheets |
| As needed | the SMS. • Check coaxial cable | Electronic documents | Time sheets |

Procedures for specific relays are found in Section 1100 in the SMS. A summary of relays and test methods currently in use is included in Appendix D.

The following are general guidelines that apply to all relays.

Biweekly inspections include:

- Visual inspection to make sure covers are seated
- · Check, record, and reset any targets

Five-year testing includes the following:

- Perform functional tests of electromechanical relays including backup and tap changing relays
- Test electronic relays using internal testing
- Check for loose wiring
- Verify and set line drop compensation
- · Test all relays associated with transfer switches and generators where applicable

Additional testing includes the following:

- · Check coaxial cable insulation condition
- Check shield-to-ground resistance

Reclosers

| Interval | Description | Inspection | Correction |
|-----------|---|--------------------------------------|--|
| Biweekly | Visual | Exception report | Exception reportTime sheets |
| 5 Years | VisualExercise equipmentOil sampleFilter oil | Electronic documents Lab reports | Job orders Time sheets |
| As needed | Visual Check contact Check pickup coil | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

- · Visual inspection to check recloser, bushings, and remove accumulated debris
- Check recloser status and mode
- Check for fluid leaks and oil level
- Check veeder counts

Five-year inspection and maintenance includes the following:

- · External visual inspection
- Operate recloser to check for:
 - Proper operation and control
 - Timing
 - Adjust settings as needed
- Oil sample dielectric, color, acidity testing
- Filter oil

Additional tests include:

- Internal visual inspection to check internals for wear and stress
- Check contact resistance
- Verify recloser pickup coil settings
- Wipe down and check porcelain for any damage

At present, hydraulic reclosers are not inspected on a multi-weekly cycle. Maintenance is done every five years.

Regulators

| Interval | Description | Inspection | Correction |
|-----------|---|--|--|
| Biweekly | Visual | Exception report | Exception reportTime sheets |
| 5 Years | Visual (external)Oil sampleFilter oil | Electronic documents Lab reports | Job orders Time sheets |
| As needed | Visual (internal) Check turns ratios | Electronic documents | Job ordersTime sheets |

Biweekly inspections include:

- Visual inspection to check for damage or debris
- Check regulator status
- · Check for fluid leaks

Five-year inspection and maintenance includes the following:

- External visual inspection to check for:
 - Connections and condition
 - Flange seal
 - Ground connections
 - Foundation
- · Oil sample for dielectric, color, and acidity test
- · Filter oil

Additional tests include:

- Internal visual inspection of connections and condition, seals and loose debris in tank
- Turns ratio through all tap positions when transformer is commissioned and when tap position changes
- · Porcelain check including wipe down

Capacitors

| Interval | Description | Inspection | Correction |
|-----------|---|--------------------------------------|--|
| Biweekly | • Visual | Exception report | Exception reportTime sheets |
| Annual | Visual (external) Exercise equipment Oil sample and measurement Relay and alarm operation Thermal imaging | Electronic documents Lab reports | Job orders Time sheets |
| As needed | Visual (internal) Check contact | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

- Visual inspection to check fusing, damage, and for debris
- · Check for fluid leaks

Annual inspections and maintenance include:

- Neutral unbalance relay range and operation, and operation of alarm communication
- Thermal imaging to check for excessive heating
- External visual inspection to check for:
 - Connections and condition
 - Flange seal
 - Ground connections
 - Foundation

Additional tests include:

- Internal visual inspection of:
 - Connections and condition
 - Seals
 - Internal leakage
 - Contact condition and alignment
 - Check for debris
- Measure contact resistance and check condition for proper operation

Grounding System

| Interval | Description | Inspection | Correction |
|----------|--|----------------------|--|
| Biweekly | • Visual | Exception report | Exception report Time sheets |
| Annual | Ground resistance measurement Ground rod check | Electronic documents | Job orders Time sheets |

Biweekly inspections include:

Visual inspection of connections and conditions

Annual inspections and maintenance include:

- Measure and plot ground resistance for the grid when the substation is commissioned or when there is damage
- Inspect accessible ground rods and redrive rods where needed

Communication Systems

| Interval | Description | Inspection | Correction |
|----------|---|----------------------|--|
| Annual | Relay operation and settings Replace RTU standby batteries | Electronic documents | Job orders Time sheets |

Annual inspections and maintenance include:

- Verify relay operation for communication
- · Verify and change relay settings when needed
- Replace and recycle standby batteries in RTU

Others Areas of Inspection and Maintenance

Tree Trimming

PSC 113 requires that the transmission and distribution systems be inspected for the presence of power line natural hazards every three to eight years.

- Trees on the electric system are presently trimmed on a 5-1/2 year cycle.
- Potential tree-related problems are noted upon discovery during system patrols.
- · Hazards to our facilities are cleared as soon as possible.
- Trees that present a future hazard are cleared as work permits, with oak pruning occurring between November through March.
- Emergency trimming is done as needed. Determination of need is based on observation by field personnel or reports by citizens.

Cathodic Protection

Inspection and maintenance of the cathodic protection system on high-pressure, oil-filled equipment and facilities is performed semiannually. There are multiple inspections involved on varying cycles. Results of the inspections and any recommendations are summarized in a semiannual report. These reports are kept in Corporate Records.

Oil-filled transmission lines - Testing of cathodic protection on oil-filled pipe for higher voltage lines is done twice a year.

Safety Equipment and Tools

Rubber goods used for safety include gloves and sleeves, hoses and blankets. These items are exchanged, cleaned, and tested on a two-month cycle. Doing so ensures these items will perform as expected and are in excellent condition.

Hot sticks are used by crews when working with equipment in the system. Hot sticks are cleaned regularly according to OSHA standards.

Miscellaneous tools and equipment used by crews in the field are cleaned and maintained by the crews as work.

Line truck buckets and booms undergo dielectric testing yearly. Booms on line trucks are load-tested annually. Trucks over 26,000 pounds get a pre-ride and a post-ride check daily.

Relay Summary Types and Tests

ALL RELAYS

Functional testing

Electromechanical, including

Beckwith backup

Tap-changing relays on transformer

Use self testing in the relays where available. Check for loose connections in the control wiring. Verify and set the line drop compensation.

Test relays associated with transfer switches and generators where applicable.

Change relay settings as required by engineering.

TEST EQUIPMENT USED

- Epoch 1
- TV2
- Relay test can
- Meters as needed for impedance, voltage and current
- Slide in test jacks
- Resistors and testers

TYPES OF RELAYS

- Overcurrent
 - Phase directional overcurrent
 - Ground directional overcurrent
 - Instantaneous overcurrent
 - Ground directional overcurrent negative sequence
 - High speed overcurrent
- Differential
 - Transformer
 - Buss
 - Percent differential
- Synch-check
- Distance
- Frequency
 - Under frequency
- Auxiliary
 - Transfer trip
- Reclosing
- Thermal
- Timing
- Power
- Voltage

TESTS FOR RELAY TYPES

- Overcurrent
 - Overcurrent pickup
 - Overcurrent timing
 - Instantaneous pickup
 - Target pickup

- Target dropout
- Directional pickup
- Directional current pickup
- Directional voltage
- Time target pickup
- Instantaneous target
- Tap pickup
- Time curve
- Contact pickup
- Instantaneous over current pickup
- Negative sequence voltage filter adjustment
- Negative sequence current filter adjustment
- Differential
 - Tap pickup
 - Slope
 - Harmonic restraint
 - Instantaneous target pickup
 - Minimum pickup
 - Percent differential
 - Time curve
 - Target pickup
 - Fault detector
 - Pickup
 - Through fault
 - Percent slope
- Synch-check
 - Closing angle
 - Timing
 - Telephone relay
- Distance
 - Full functional
 - Setting
 - Meter
 - Mho unit
 - Directional element
 - Residual overcurrent
 - Residual time-overcurrent timing
 - Phase overcurrent
 - Loss-of-potential
 - DG and DP timer tests
 - Remote end just open
 - Switch onto faults
 - Recloser
 - Synchronizing and polarizing voltage
 - Voltage checking logic
 - Synchronism checking logic
 - Input circuits
 - Serial ports
 - Time code input
 - Power supply voltage
 - Three phase reach
 - Three phase angle of max torque

Relay Summary Types and Tests

- Phase to phase reach
- Phase to phase angle max torque
- Target pickup
- Mho unit spring adjustment
- Ohmic reach test
- Angle of max torque
- Ohm unit spring adjustment and reach test

Frequency

- Frequency trip
- Telephone relay
- Target pickup
- Frequency and timing
- Under voltage dropout

Auxiliary

- Unit test
- Opening test
- Coil pickup

Reclosing

- Timing
- Pickup timing delay
- Pickup
- Reset
- Reset timing
- Reclose timing

Thermal

- Overload
- Preload
- Instantaneous
- Instantaneous target
- Time target pickup

Timing

- Telephone relay pickup
- Timing
- Target pickup

Power

- Relay pickup
- Relay timing
- Target pickup

Voltage

- Under voltage pickup
- Timing under voltage
- Target pickup

Overhead Capacitor Banks

Distribution Capacitor Bank Inspection Procedures

Completed annually and during the year as necessary

Fixed, Half-Switched, or Switched Capacitor Banks

- Check for blown fuses or arresters.
- Check for ruptured units.
- · Check for leaking units.
- Check for damage by wildlife (chewed equipment/wires, bird/squirrel nests)
- Check control box (if applicable) for external damage.
- Check whether fuses are removed, for seasonal banks from September to May when loads are lower.
- Check records as to location, voltage, circuit, phases, trip/close status, seasonal, size, number, type (fixed, half-switched, switched) and current-sensing phase (if applicable).
- Record and describe any visible damaged equipment or extraordinary configurations.

Half-Switched Capacitors / Switched Capacitors (Current-Controlled or Voltage-Controlled)

- Check records as to control mode (manual, current, voltage).
- Determine whether the bank is closed or tripped via visual inspection of the oil switches.
- Check to ensure that the sensor for any current-controlled bank is downstream of the substation.
- Open control box and inspect internal conditions for damage or physical degradation.
- Record the value of the operations counter.
- Compare existing control settings (voltage or current) to previous records.
- Ensure that a spare fuse is available in the control box.
- Verify switch and control operation
- Record problems (blown control fuses, switch misoperations, on/off times less than 60 seconds, counter miscounts, swings in current, dramatic or null voltage changes).

Report problems to Electric Operations.

Substation Inspection Checklist for the Biweekly Inspections (Inspections done by the Electric Meter Shop)

Reporting Method for the Electric Meter Shop

Confirm proper pressure in all SF6 equipment.

Porcelain condition

The following checklist is to be used for determining abnormal items (exceptions). These are reported one of two ways:

All exceptions are logged into a spreadsheet (called "exception.xls" on the engineering network) to be evaluated by Substation Maintenance for follow-up.

All critical items that need Immediate Response are reported to the Substation Maintenance Supervisor.

The Bi-weekly Inspection Checklist

| | The Di-weekly inspection Checkist |
|---------|---|
| St | tation Batteries and Associated Equipment |
| | Overall visual inspection of batteries and associated equipment checking for deterioration. |
| | Electrolyte fluid level and leaks. (Including sediment and corrosion) |
| | Check battery charger currents and grounds. |
| Po | ower Transformers |
| | Nitrogen gas pressure checks. |
| | Gas and oil leaks. (Gas blowing / hissing) |
| | Oil level and temperature check. |
| | Winding temperature. (TRO) |
| | Cooling fan status. |
| | Oil circulating pump status. (on automatic) |
| | Porcelain condition. |
| | Desiccant filter condition. (Purple is good, Pink is bad) |
| | Compartment heaters. |
| Lo | oad Tap Changers |
| | Check for oil level, oil leaks and gas leaks. (Gas blowing / hissing) |
| | Veeder count (number of operations). |
| | Tap position and range, resetting drag hands as applicable. |
| | Control setting and mode. (on automatic) |
| ב | Compartment heaters. |
| Po | wer Circuit Breakers |
| ב | Oil leaks. |
| _ | Status of breaker, control and recloser. (supervisory or manual) |
| ב | Verify trip air pressure and check for leaks. (spring or air charged) |
| 3 | Veeder counts. (operations) |
| ב | Check over compressor, drain water and check pressures. |
| ב | Accumulator pressure and hydraulic pressure. |
| | - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 |

Substation Inspection Checklist for the Biweekly Inspections (Inspections done by the Electric Meter Shop)

| Disconnect | Switches |
|------------|-----------------|
|------------|-----------------|

- □ Visual inspection of switch components checking for any damage, positive and proper seating (flush), and no obstructions.
- □ Check for broken insulators.

Bus Work

- □ Visual inspection checking for any damage.
- Check for broken insulators.

Emergency Generators

- □ Visual inspection of generators and batteries checking for leaks, corrosion, and structural damage.
- Check fluid levels.

Relays - General

The following are general guidelines that apply to all relays.

- □ Visual inspection making sure covers are seated.
- □ Check, record and reset any targets.

Reclosers

- Usual inspection to check recloser, bushings and remove accumulated debris.
- □ Check recloser status and mode.
- □ Check for fluid leaks and oil level. (Check DC Battery)
- □ Check Veeder counts. (Record in log book)

Regulators

- □ Visual inspection to check for damage or debris.
- □ Check regulator status.
- Check for fluid leaks.

Capacitors

- Visual inspection to check fusing, damage and for debris.
- □ Check for fluid leaks. (read Veeder count and record in log book)

Grounding System

□ Visual inspection of connections and conditions. (if they can be seen)

Miscellaneous Items

- Cathotic Protection check for oil leaks and fusing
- □ Replace burnt out lamps
- □ Fire extinguisher check
- □ Security check Fencing, gates and locks
- Check auto transfer switch for station service
- □ Check auto transfer S&C gear for ready light, general condition and Veeder counts (record in log at the site)
- □ BGS (Backup Generation Service) units inspect using the "Generator Inspection Checklist".

^{*} If READY light is not on, see back for list of possible reasons.

CONDITIONS REQUIRED FOR THE READY LIGHT

Manual/automatic selector switch in AUTOMATIC.

Both source voltages are good.

Alternate source switch or bus tie switch is open. The normal source(s) switch is closed.

Switch operators are charged and coupled to switches.

Switch compartment doors are closed and latched.

Overcurrent LOCKOUT is reset (if the switchgear has this option).

Key interlocks are unlocked (if the switchgear has interlocks).

Voltage unbalance detection feature is on (if the switchgear has this option).

MEMORANDUM

DATE:

November 15, 2000

TO:

Pat Baldwin

on

Doug Bufton

Larry Capps
Dale Freiman

Rick Jilot

Al Mickelson(Forms)

Don Pierstorff (Forms)

Dick Schwarz

Dennis Steinhorst

FROM:

John Capacio 4

Jerry Peplinski

SUBJECT:

Rubber Goods Exchange

Please inform all concerned personnel that the exchange of rubber goods is scheduled for the week of *November 20, 2000*. ETD staff will exchange their rubber goods at the Stores service counter in the Central Service Center. Electric Production, Meter and Connection, and Electric Meter Shop personnel will exchange their rubber goods at the Service building.

ETD Personnel

Attached are the Rubber Goods Exchange Forms for ETD staff. The truck assignments came from the ETD Crew List of the Week of November 20, 2000. The glove and sleeve sizes for ETD personnel and trucks came from data recorded from previous rubber goods exchanges. Rubber mitts and other items such as leather shields for 20kV gloves and 1kV gloves, sleeve buttons, glove powder, etc. are available from the Storeroom. Please note: There are no requisitions for ETD supervisory personnel for this exchange. If you need to exchange your gloves, please do so at the CSC Storeroom.

For ETD personnel who are on vacation this week and report to the CSC, please hold the form until they return and have them exchange their rubber goods at the Stores service counter. If they report to Fitchburg, Cross Plains, or Job Site, have them complete the form and send it to Stores. Stores will arrange to deliver their new rubber goods and pick up their old rubber goods.

For all other ETD personnel, have the crew leader confirm the size information for gloves and sleeves. Turn the form in to the Storeroom. Stores personnel will fill each request during the week. Stores personnel will place the requested items in a tote and place the tote next to the vehicle. ETD crews will remove the new rubber goods from the tote and place their old rubber goods in the tote. Stores personnel will bring the tote back to the Storeroom.

Note: Rubber blankets will not be exchanged this time. Line hose will be exchanged instead. ETD staff should see their supervisor for details.

Meter and Connection, Electric Production, Electric Meter Shop and Gas Distribution.

Electric Production will pick up their standard order from the Electric Meter Shop. Please exchange the new rubber goods for the old and return the old gloves to the Electric Meter Shop.

All other personnel with the exception of Meter and Connection personnel reporting to Fitchburg will exchange their rubber goods at the Electric Meter Shop. The rubber goods exchange for Meter and Connection personnel reporting to Fitchburg will be handled by the Superintendent - Electric Measurement and Service.

If you have any questions regarding the rubber goods exchange, please call John Capacio at extension 7038 or Jerry Peplinski at extension 7378.
